Why does my laptop keep shutting down without removing the battery?

At times, when a system is forced to shut down without following the appropriate process (e.g., pulling out the battery), the laptop's Power Management settings get altered. We could fix it as follows: Press Win + R to open the Run window and type the command `powercfg.cpl`. Press Enter to open the Power Options window.

What causes a battery to shut down?

Battery malfunctions can create sudden shutdowns. A battery may have internal defects or age-related wear that affects its ability to supply power. An example is when a lithium-ion battery, which loses capacity over time, doesn't hold enough charge, leading to abrupt power loss.

How do I fix a laptop that shuts down when unplugged?

Running the Power Troubleshooter is an easy way to fix software issues that make a laptop shut down when unplugged. This tool looks for wrong power settings, driver issues, and other power problems, then tries to fix them automatically. Press Windows + I to open Settings. Go to Update and Security. Under Find and fix other problems, find Power.

Why does my computer keep shutting down?

As computers require a specific amount of power to operate, too great a reduction can force the computer to shut down. If this situation applies to your computer, unplug its power cord from the surge protector or battery back-up unit, and plug it directly into a wall outlet. Turn on the computer to see if the problem persists.
